Mr Peter Zenni
Executive Manager Development Services
Shire of Merredin
PO Box 42
Merredin WA 6415

Dear Peter

REQUEST TO EXTEND TEMPORARY PLANNING APPROVAL

I refer to temporary planning approval dated 18 July 2018 for access, truck marshalling and weighing, grain sampling and staff facilities at CBH's western open bulkheads site on lot 503 Gabo Avenue Merredin.

The approval will lapse on 18 July 2019 and request an extension of 12 months to 18 July 2020.

Please find attached application for development approval form and confirm proposed development includes the following:

- Access from Goldfields Road
- Truck marshalling area for 15 trucks
- Grain sampling platform/hut and two spears
- Staff lunchroom, toilets, septic system and carpark
- Weighbridge and hut
- Internal roads and stormwater drainage.

I also confirm the following drawings enclosed with the application for planning approval dated 6 April 2018 are valid:

- CBH overall general arrangement (site) plan 2018-438-1101_A
- CBH general arrangement drawings STD-101-0000_9 and 0006_13 for the sample platform/hut
- CBH general arrangement drawings S-020-A0000_2 sheet 2 of 5 and S-020-A0050_7 sheet 2 of 2 for the weighbridge and hut
- Fleetwood floor plans and elevations for the lunchroom LR-01-A-100_A and toilets MTF-02-A-100_A
- CBH overall site drainage plan 2018-438-1301_A.

If you have any enquiries or require further information, please contact me on 9216 6094, 0439 969 835 or by email at tim.dolling@cbh.com.au.

Yours sincerely

For: Co-operative Bulk Handling Limited

1. Introduction

1.1. Background

Co-operative Bulk Handling Limited (CBH) is proposing to upgrade and expand the existing grain receiving and storage facility in Merredin. The development proposes a new marshalling area, sampling point, weighing facility and ancillary works to rationalise the handling of the current annual receipt of 750,000 tonnes of grain. The internal layout and traffic flow of the site is also being modified to alleviate throughput issues.

The site is located between Goldfields Road and Gabo Avenue and is adjacent to the existing Open Bulkhead (OBH) numbers 9 to 14. The site is west of the Merredin town site as shown in **Figure 1**.

Figure 1: CBH Merredin Site

1.2. Scope and Purpose

The purpose of this assessment is to determine the traffic impact of the proposed expansion on the surrounding road network.

The facility has been designed to support the following capacities.

- Incoming capacity of 705,800 tonnes per annum (tpa) including 240,000 tpa for years 1 to 10 (4,800 movements per annum) to OBH 9 to 14 plus about 465,800 tpa to the other site storage areas (estimated at 9,316 movements per annum); and
- Outgoing capacity of 240,000 tpa for years 1 to 10 (7,000 movements per annum) from OBH 9 to 14 to the balance of the site (smaller payload assumed);

The total number of truck movements to and from the site is not expected to vary significantly from that currently being experienced; however, the access and egress pattern will change in the immediate vicinity of the site. Incoming movements will be via Goldfields Road with trucks exiting onto Gabo Avenue. Outgoing movement of grain will largely be via Gabo Avenue with grain being moved from OBH 9 to 14 to the rail head. The site is being designed for access by Restricted Access Vehicle (RAV) Category 7 trucks with a maximum permitted length of 36.5m. An example vehicle is shown in **Figure 2**.

Figure 2: Example RAV Category 7 Vehicle

This assessment has been undertaken in accordance with the Western Australian Planning Commission (WAPC) *Transport Impact Assessment Guidelines Volume 4 – Individual Developments* (TIA Guidelines). Based on the type and scale of development, the appropriate standard of assessment is a Traffic Impact Statement (TIS) with additional consideration given to the higher proportion of heavy vehicle movements to the site.

According to the TIA Guidelines, the key objectives of a TIS are to:

- Assess the proposed access arrangements for all modes of transport;
- Assess the level of transport integration between the development and the surrounding land uses;
- Determine the impacts of the traffic generated by the development on the surrounding land uses; and
- Determine the impacts of the traffic generated by the development on the surrounding transport networks.

2. Proposed Development

The proposed development includes the following upgrades and new facilities:

- New truck marshalling area;
- New sampling hut and weighbridge areas;
- Additional installation of fixed equipment; and
- New road layout to existing and proposed infrastructure.

The concept site plan is shown in **Figure 3** and attached as **Appendix A**.

Figure 3: CBH Merredin Site – Concept Plan

3. Vehicle Access and Parking

3.1. Vehicle Access

Vehicle access to the site will primarily be via Goldfields Road with egress onto Gabo Avenue. Secondary access is to be provided off Gabo Avenue for trucks originating from the existing site. Access to Goldfields Road from the east is via a connection to Chandler – Merredin Road; access to and egress from Gabo Avenue is primarily via Crooks Road to the west which in turn provides connection to Goldfields Road and Great Eastern Highway.

3.2. Parking

While passenger car movements to the site are likely to be low provision has been made for parking in formal parking areas located on the eastern side and on the southwest corner of the development site.

A new truck marshalling area with capacity for 30 RAV 7 trucks will be constructed along the eastern boundary of the site off Goldfields Road. Dedicated access lanes are to be provided past the marshalling area for offsite sampled loads and light vehicles. The layout of the proposed truck marshalling area is shown in **Figure 4**. With a capacity to store up to 30 RAV 7 (Road Trains) together with the number of trucks accommodated at the sampling shed, weighbridge and onsite at the OBH, queuing back onto Goldfields Road is unlikely to occur.

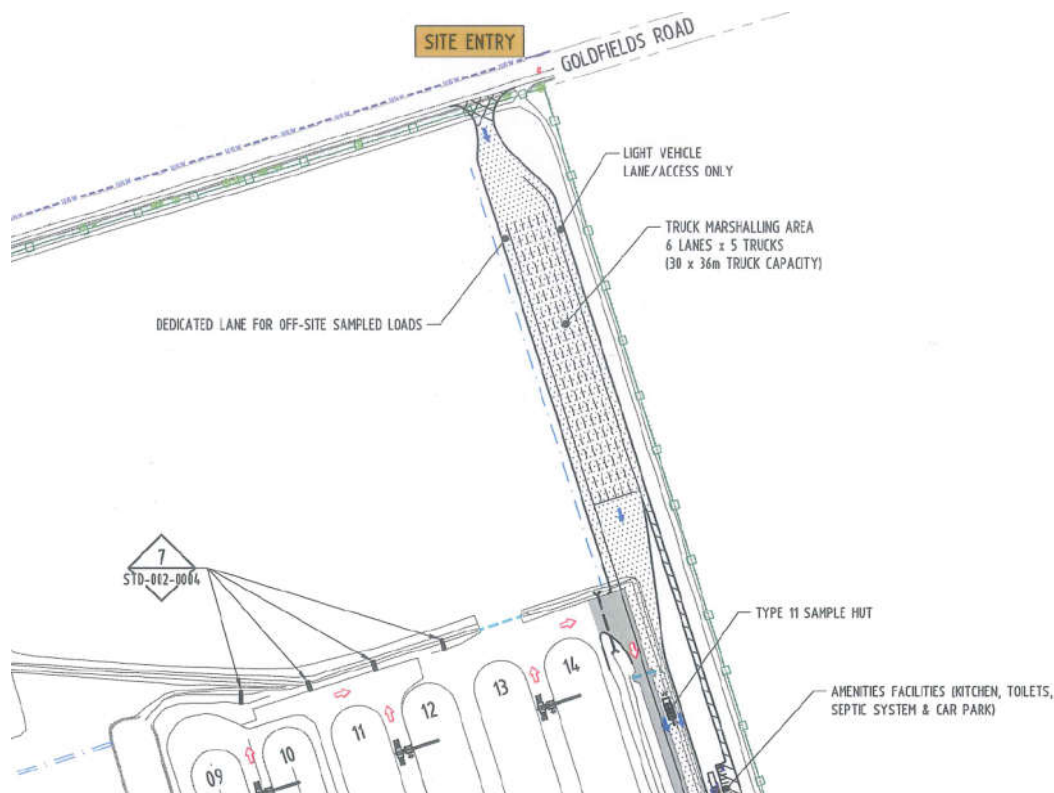

Figure 4: Proposed Truck Marshalling Area

3.3. Operational Details

The operational lifetime of the site is expected to be 10 years after which an expansion of OBH's (OBH 15 to OBH 28) may occur.

The site operates on a seasonal basis for 2 to 3 months from October to mid-January each year and it is expected that based on a receipt of 705,800 tonnes activities will generate approximately 180 movements into the site and 180 movements out of the site each day. This assumes an average truck payload of 50 tonnes. During the remainder of the year, the site would generate minimal traffic estimated to be in the order of 10 movements in and out of the site daily. Transfer of grain from OBH 9 to 14 may generate approximately 27 movements daily with these affecting Gabo Avenue only. This will occur outside of the peak season.

4. Traffic Volumes and Vehicle Types

4.1. Daily Traffic Generation

The proposed site will initially see approximately 240,000 tonnes received into OBH 9 to OBH 14 with the another 465,800 tonnes received in the balance of the site's facilities. It is assumed that under the worst case scenario, all incoming trucks will use the new sampling hut and weighbridge facilities and will enter from Goldfields Road and exit via Gabo Avenue. Assuming an average truck payload of 50 tonnes and a 12 week operating period this will equate to approximately 180 movements into the site and 180 movements out of the site daily.

4.2. Peak Hour Traffic Generation

The number of trips generated during the peak hour of operation has been estimated by CBH for the Merredin site based on an inverted bell curve distribution and this estimates that during the AM and PM peak hours, the site generates on average 25% of daily truck trips. Applying this basis to estimate the peak for the Merredin site suggests that the site would generate in the order of 44 trips into the site and 44 trips out of the site in a peak hour period. It is assumed that the peak hour of operation on the site coincides with the peak hour on the road network. Given the layout of the site, the distribution of traffic onto the adjacent road network is expected to be as shown on **Figure 5**.

Figure 5 - Predicted Flows (Daily / Peak Hour)

4.3. Traffic Management on Frontage Streets

Gabo Avenue and Crooks Road between Gabo Avenue and Great Eastern Highway are classified as Local Distributor roads and are under the jurisdiction of the Shire of Merredin. In the vicinity of the site, they are constructed as two-lane single carriageway roads and have a derestricted speed limit. Goldfields Road and Crooks Road north of Gabo Avenue are access roads and are also under the jurisdiction of the Shire of Merredin. They are also constructed as two lane single carriageways and have derestricted speed limits.

The intersection of Gabo Avenue and Crooks Road forms an unchannelised T junction while the intersection of Goldfields Road and Crooks Road forms a priority controlled four way intersection. Crooks Road intersects with Great Eastern Highway as a priority controlled T-junction and has dedicated left and right turning lanes provided.

Goldfields Road, Gabo Road, Crooks Road and Great Eastern Highway are all on the RAV 7 Network.

4.4. Existing Traffic Volumes

Count data for Goldfields Road, Gabo Avenue and Crooks Road was not available; however outside of harvest season the flows on these roads is expected to be no more than 100 vehicles daily and 10 vehicles in the peak hour with the exception of Gabo Avenue where flows are expected to be double that. The latest traffic count data for Great Eastern Highway was obtained from the Main Roads WA Reporting Centre as summarised in **Table 1**.

Table 1: Great Eastern Highway Average Weekday Traffic Counts (August 2014)

Time Period	Eastbound	Westbound	% Heavy Vehicles
Daily	793 vpd	752 vpd	23%
AM Peak Hour (9 – 10 am)	57 vph	70 vph	
PM Peak Hour (3 – 4 pm)	67 vph	65 vph	

As the counts were taken in early September, they are assumed to represent background counts and do not include traffic generated by the CBH facility.

4.5. Predicted Maximum Traffic Flows

Based on the generation rates indicated in Sections 4.1 and 4.2, the expected maximum movements are shown on **Table 2**. This assumes an even directional split in traffic along Goldfields Road, Crooks Road and Great Eastern Highway. Base flows on Goldfields Road and Crooks Road in the vicinity of Gabo Avenue are assumed to be 100 vpd and 10 vph. Base flow on Gabo Avenue is assumed to be higher at 200 vpd and 20 vph. Base flow on Crooks Road immediately north of Great Eastern Highway is assumed to carry an increased volume of traffic on account of the access and egress from the Department of Agriculture site and base flows of 1,000 vpd and 100 vph are assumed.

Table 2 - Predicted Maximum Flows

Location	Daily NB/EB	Daily SB/WB	AM Peak Hr NB/EB	AM Peak Hr SB/WB	PM Peak Hr NB/EB	PM Peak Hr SB/WB
Goldfields Rd (Existing)	50 vpd	50 vpd	5 vph	5 vph	5 vph	5 vph
Goldfields Rd (Predicted)	230 vpd	140 vpd	50 vph	27 vph	50 vph	27 vph
Crooks Rd nr Gabo (Existing)	50 vpd	50 vpd	5 vph	5 vph	5 vph	5 vph
Crooks Rd nr Gabo (Predicted)	140 vpd	140 vpd	27 vph	27 vph	27 vph	27 vph
Gabo Ave (Existing)	100 vpd	100 vpd	10 vph	10 vph	10 vph	10 vph
Gabo Ave (Predicted)	190 vpd	280 vpd	32 vph	32 vph	32 vph	55 vph
GEH (Existing)	793 vpd	752 vpd	57 vph	70 vph	67 vph	65 vph
GEH (Predicted)	883 vpd	842 vpd	68 vph	81 vph	78 vph	76 vph

Given the low numbers of vehicles entering the intersections of Crooks Road and Gabo Avenue and Crooks Road and Goldfields Road, operational performance is predicted to be satisfactory and modelling is not considered necessary. For the higher flows entering the Crooks Road and Great Eastern Highway intersection, expected peak hour movements were estimated and are shown on **Figure 6**.

Figure 6 - Predicted Turning Movements

5. Site Specific Issues

5.1. Intersection Capacity

The capacity of the Crooks Road / Great Eastern Highway intersection to accommodate the increased traffic movements from the site has been assessed using SIDRA Intersection 7.0 and the assessment output is shown on **Figure 7**. This indicates that the intersection is expected to operate at a satisfactory Level of Service, with minimal delays and negligible queues.

Movement Performance - Vehicles											
Mov ID	ODMo v	Demand Total veh/h	Flows HV %	Deg. Satn v/c	Average Delay sec	Level of Service	95% Back Vehicles veh	of Queue Distance m	Prop. Queued	Effective Stop Rate per veh	Average Speed km/h

Figure 7 - Sidra Output

5.2. Turn Treatments

Warrants for turn treatments as determined in accordance with Austroads Guide to Road Design – Part 4A: Unsignalised and Signalised Intersections, indicated that the intersection treatment as currently exists at the intersection of Crooks Road and Great Eastern Highway defines appropriate geometry - refer **Figure 8**. The low entry volumes on the other intersections preclude the need for turn treatments.

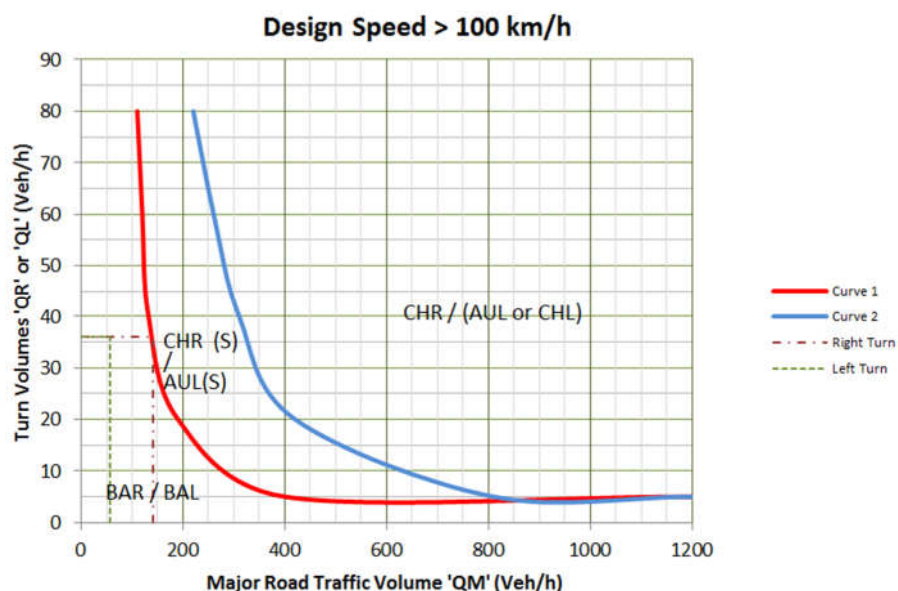

Figure 8 - Intersection Turn Treatment Warrants

5.3. Sight Distance Requirement

5.3.1. Approach Sight Distance

The Approach Sight Distance (ASD) for road trains is required to ensure that trucks approaching an intersection at the 85th percentile operating speed, are able to observe intersection configurations and stop safely. The ASD for trucks is measured from truck driver eye height (2.4m) to the pavement level at the stop or holding line. The operating speed on Crooks Road, Goldfields Road and Gabo Avenue has been assumed as 50km/h taking into consideration the operating road environment and proximity of the CBH site and facilities to the intersections minimising the ability for trucks to accelerate.

The ASD as required for approach to all intersections is calculated from Equation 1 of Austroads Part 4A and is summarised in **Table 3**.

Table 3 - Approach Sight Distance

Operating Speed	Reaction Time	Coefficient of Deceleration	ASD
50 km/h	3.5 s	0.2	98m

5.3.2. Safe Intersection Sight Distance

The Safe Intersection Sight Distance (SISD) is the minimum distance which should be provided on the major road at any intersection to allow for a vehicle on the major road to observe a vehicle on a minor road and moving into a collision situation to stop safely before the collision point.

The SISD is calculated for both Crooks Road / Gabo Avenue, Crooks Road / Goldfields Road and the Crooks Road – Great Eastern Highway intersection from Equation 2 of Austroads Part 4A and results are summarised in **Table 4**.

Table 4 - Safe Intersection Sight Distance

Road	Operating Speed	Decision Time	Coefficient of Deceleration	Longitudinal Grade	SISD
Crooks Road and Gabo Avenue	100 km/h	5.5 s	0.24	0%	270 m
GEH	110 km/h	5.5 s	0.24	0%	309 m

5.3.3. Entering Sight Distance

The Entering Sight Distance (ESD) is the minimum distance which should be provided from the minor road so that the driver of a RAV, entering a through road, can identify a sufficient gap in oncoming traffic that will allow a RAV, with greater length and a lower accelerating capacity, to clear the intersection safely.

Using Appendix F of the MRWA RAV Guidelines, shown in **Figure 9**, the required ESD (assuming level terrain)

can be extrapolated.

Operating Speed km/h	Downhill (approaching traffic)				Level	Uphill (approaching traffic)			
	-8%	-6%	-4%	-2%		2%	4%	6%	8%

RAVs Categories 5-8

40	102	100	97	96	94	93	91	90	89
50	137	133	130	127	124	122	120	118	117
60	176	170	165	161	157	154	151	149	147
70	218	210	204	198	193	189	185	182	179
80	264	254	245	238	231	226	221	216	213
90	314	301	290	281	272	265	259	254	249
100	377	360	345	332	321	312	304	296	290
110	463	437	415	397	382	369	357	347	339

Figure 9 - Entering Sight Distances MRWA RAV Guidelines

Table 5 - Entering Sight Distance

Road	Operating Speed	Longitudinal Grade	ESD
Entering Crooks Road	100 km/h	Assume 0%	321m
Entering GEH	110 km/h	Assume 0%	382m

5.3.4. Sight Distance Assessment

The available sight distance from the intersections of Crooks Road – Gabo Avenue and Crooks Road – Goldfields Road is estimated as being in excess of 350 metres on all legs and as such the available sight distance exceeds the requirements.

Determination of the sight distance available at the Crooks Road – Great Eastern Highway intersection suggests that in excess of 450 metres is available and this is likely to meet guideline requirements.

5.4. Acceleration Lanes

In accordance with MRWA RAV guidelines, acceleration lanes are warranted when:

- The speed limit is at least 80km/h; and
- The AADT is greater than 1,000 Passenger Car Equivalence (PCE); and
- There is no overtaking lane on the RAV road at or near the point of entry from a side road.

The length of acceleration lane shall be sufficient for a RAV vehicle to reach a speed of at least 70% of the

operating traffic speed at the point of merge with the through road.

There are a high number of heavy vehicles travelling along Great Eastern Highway including Category 7 RAV's.

Given the status of Great Eastern Highway and Crooks Road as RAV Network 7 roads it is assumed that the assessment of warrants for acceleration lanes has been previously reviewed and the current configuration found to be acceptable. Also, while works planned for the CBH site will result in changes on traffic flow patterns on the immediate road network, it is not expected that current patterns will change at the Crooks Road – Great Eastern Highway intersection.

6. Safety Issues

The crash history of the adjacent road network for the five year period ending December 2016 was obtained from the Main Roads WA Reporting Centre. Only two incidents have been recorded as detailed in **Table 6**.

Table 6: Crash History Summary

Road and Location	Crash Type	Severity
Intersection of GEH – Crooks Road	Hit Object	Medical
Intersection of Crooks Road and Insignia Way	No crashes recorded	N/A
Intersection of Crooks Road and Gabo Avenue	No crashes recorded	N/A
Intersection of Crooks Road and Goldfields Road	No crashes recorded	N/A

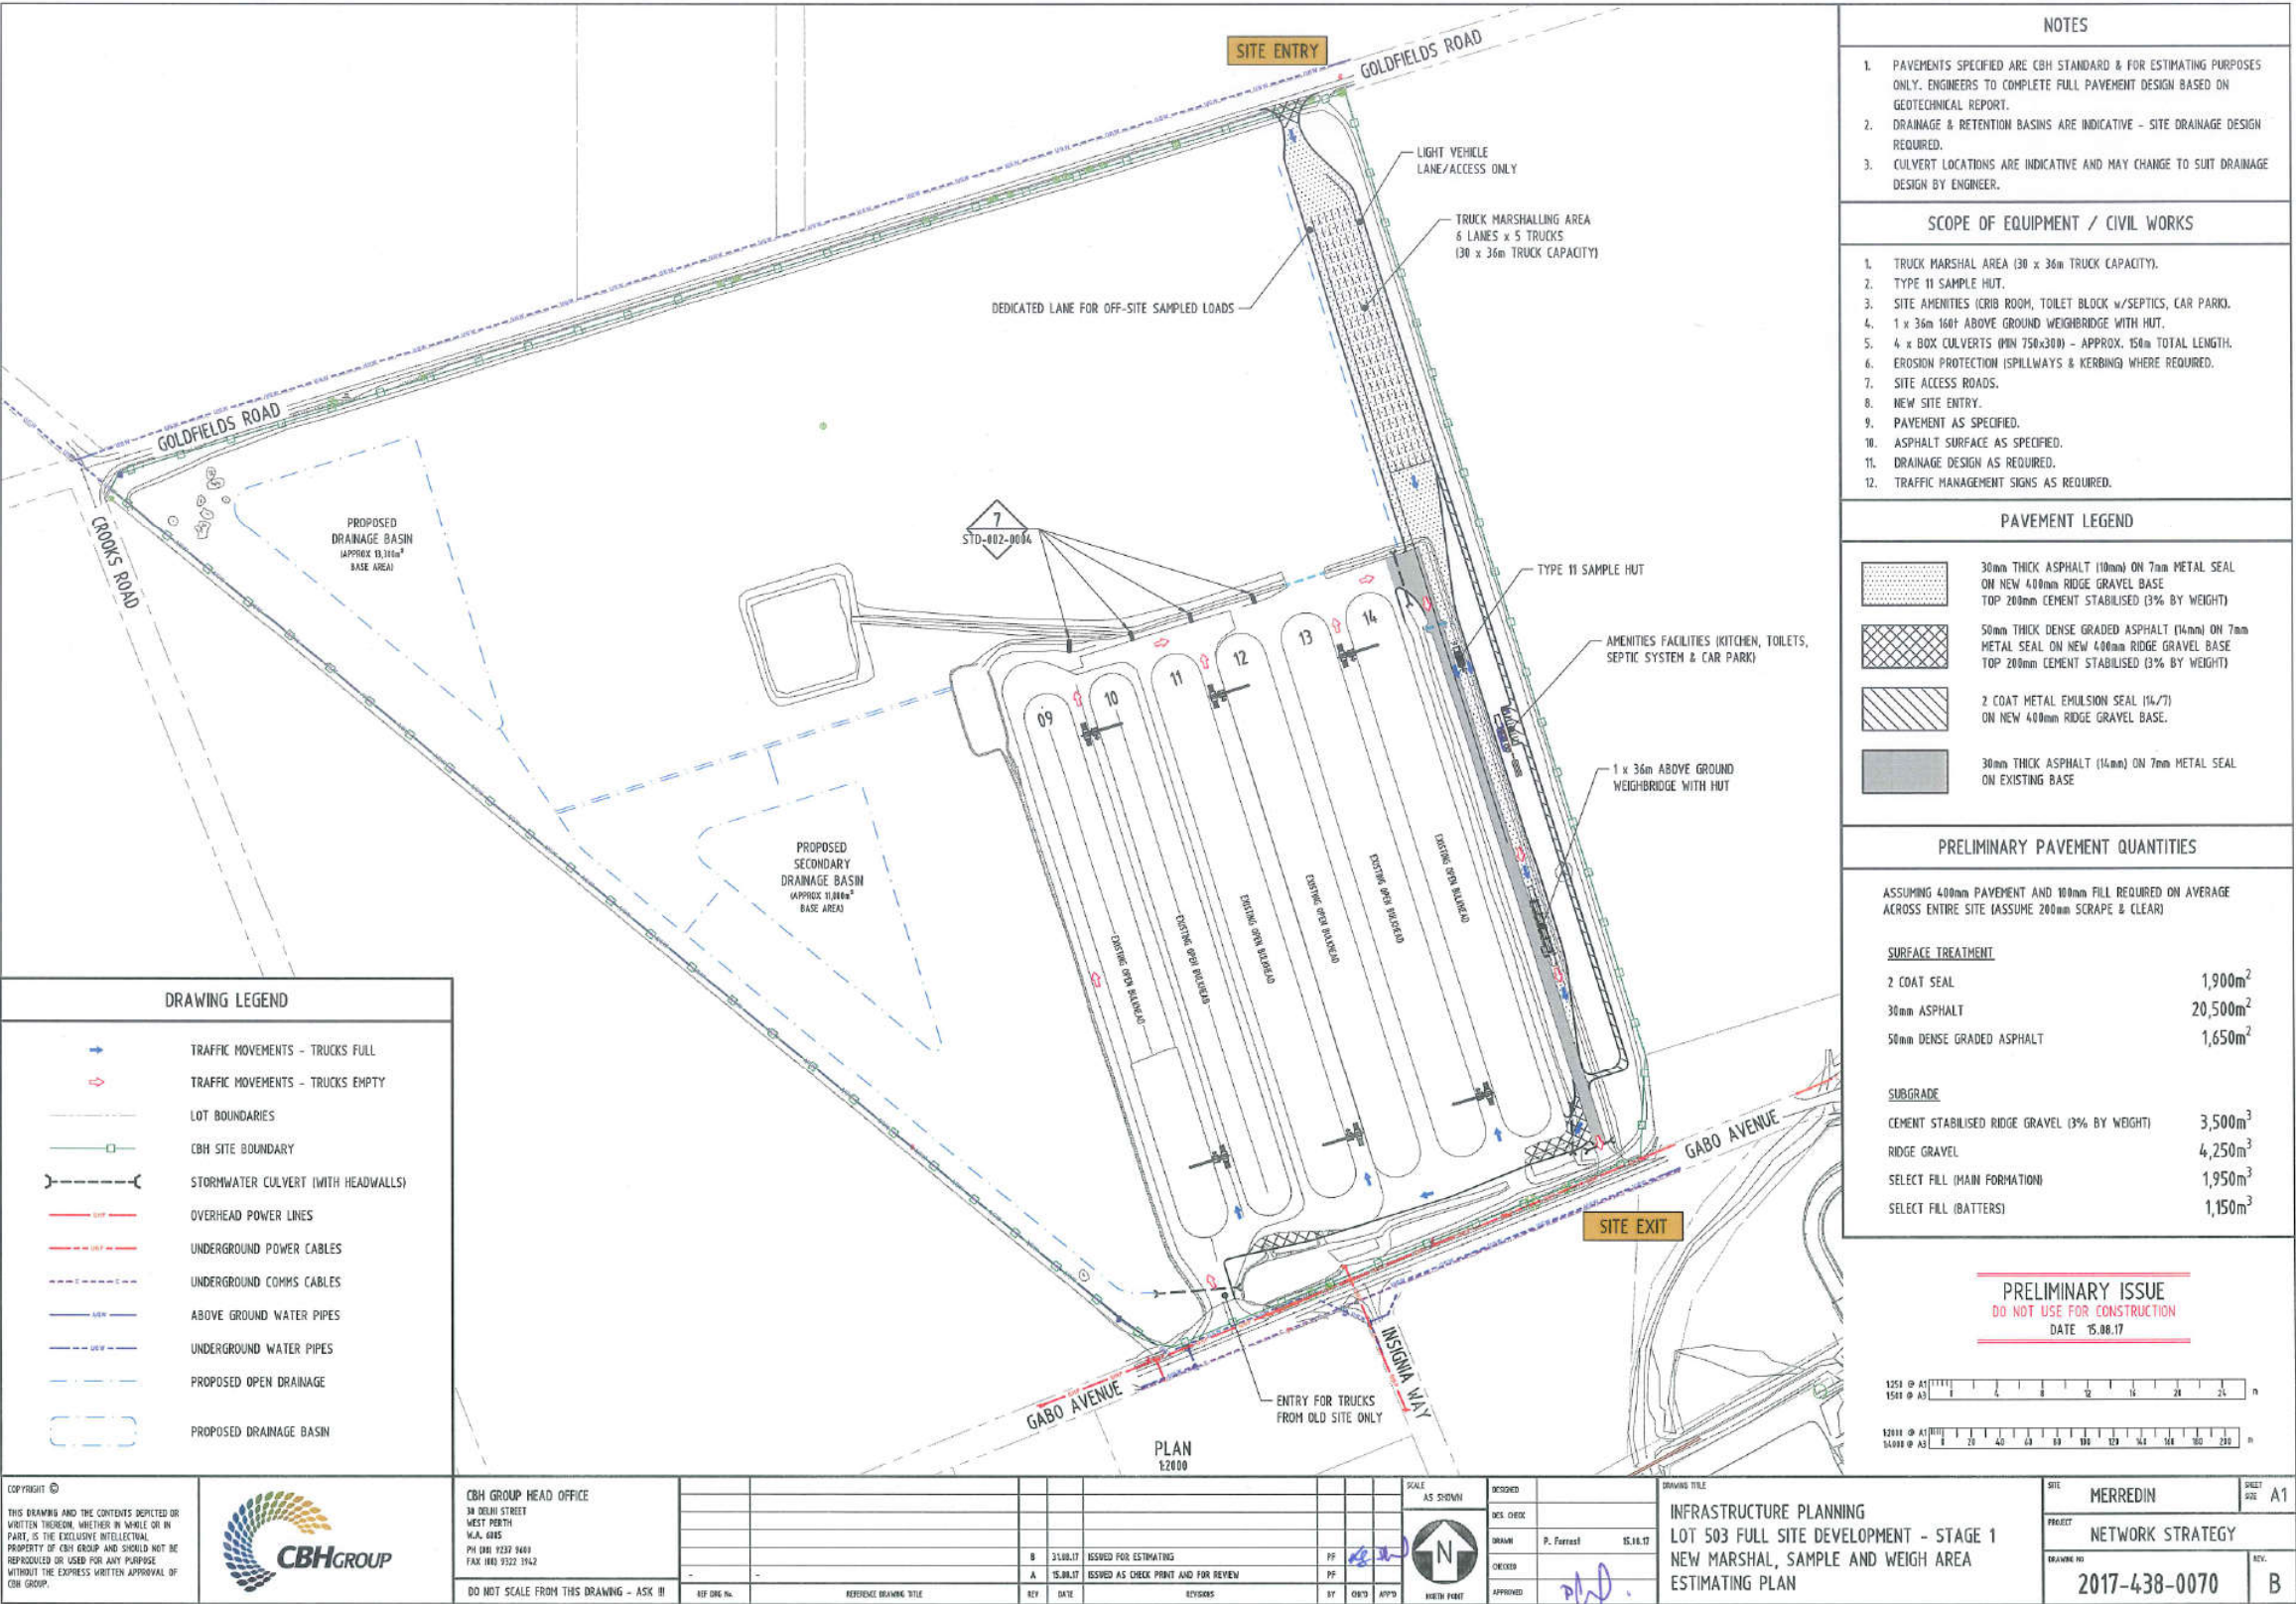

The crash history of the immediate road network does not indicate any particular safety issue and while the proposed development may affect the pattern of traffic on the road network, this is not expected to increase the likelihood of crashes above acceptable levels.

7. Conclusion

A review of the proposed improvement works at the CBH Merredin site was carried out to determine if any adverse traffic impacts were associated with the proposal. The assessment concluded that:

- The traffic generated by the site during harvest periods is expected to be in the order of 180 movements in and 180 movements out daily with about 44 movements in and out during peak hours;
- The proposed marshalling yard allows for storage of 30 RAV 7 vehicles and with the internal operation will have adequate storage for the peak hour allowing trucks to queue on site and clear of Goldfields Road;
- Over the foreseeable future the traffic generated is likely to be consistent in magnitude to that currently generated and rather than increasing flows, the proposed development is more likely to result in a change in traffic patterns;
- While the modified traffic flows are likely to affect the immediate intersections, the operational performance of the intersections and safety for road users is not predicted to be compromised;
- The operation of the intersection of Crooks Road and Great Eastern Highway is not expected to change; and
- No warrants for improvements to the existing road network infrastructure were identified.

Appendix A – Concept Site Plan

Peter Zenni

From: Dickie, Rob <Rob.Dickie@cbh.com.au>

To: Peter Zenni; Greg Powell
Cc: Walker, Allan; Dolling, Tim; Gliddon, Sam; Anderson, Peter
Subject: Information requested from CBH on Merredin receival site

Dear Peter and Greg

Following my conversation with Peter, I have provided some supporting information with regards to our receival site storage capacity, average receivals, and the impact of additional tonnage being received at the site under CBH's Network Strategy change.

Merredin receival site:

- Has 500,000 tonnes of storage capacity with average receivals of 350,000 tonnes
- Receivals (in the catchment zone) are forecast to grow to an average 410,000 over the next 5 years (forecast subject to assumed yield growth)
- As a result of closing non Network Strategy sites (ie Burracoppin, Hines Hill and Nungarin) an additional 55,000 tonnes are expected to flow into Merredin.
- Merredin will have the sufficient storage capacity to handle forecast receivals of 465,000 tonnes of receivals at harvest.
- In addition, and as we do now, an approximate 240,000 tonnes will be hubbed into the site, from surrounding Network Strategy sites, outside of harvest, resulting in approximately ~ 700,000 tonnes being railed from Merredin.

I have copied Alan Walker to this message and appreciate if you could send him an invite to attend the Council meeting, as per your request.

Kind Regards

Rob Dickie
